Vehicle seat

For a vehicle seat whose support surface facing the user forms the outside of a wall (9, 10, 11) whose inner side borders at least one channel (12) through which air flows, the wall (9, 10, 11) is at least substantially impermeable to air at the pressure prevailing in the channel (12). In addition, the wall is composed of a material which, when there is a drop in the water vapor partial pressure from the outside to the air flowing through the channel (12), transports water vapor in the direction of this partial pressure drop.
